

Specification of the Noug DSL

Simon Cockx

October 19, 2021

The goal of this work is two-fold. On the one hand it aims to eliminate flaws from the Rosetta language by formalizing its grammar and typing system. On the other hand it seeks to give solid ground for developers of code generators, giving a single source of truth about the intended semantics of generated code. Note that these goals also constitute two different audiences; one the developers of Rosetta, the other parties interested in translating Rosetta to a new language.

Throughout this document, T and S represent basic types and C represents a cardinality.

1 Syntax

Metavariables: D and E range over entity names, F ranges over function names, a and b range over attribute and parameter names, i and j range over signed integers, k and l range over positive integers, r ranges over signed decimals. Whitespace is ignored.

$\langle DD \rangle ::=$	<i>entity declarations:</i>	$\langle E \rangle$ (all any)? (= <>) $\langle E \rangle$
type D (extends E)? :		$\langle E \rangle$ (+ -) $\langle E \rangle$
$\langle AT \rangle^*$		$\langle E \rangle$ (* /) $\langle E \rangle$
$\langle FD \rangle ::=$	<i>function declarations:</i>	$\langle E \rangle$ count
func F :		$\langle E \rangle \rightarrow a$
inputs : $\langle AT \rangle^*$		if $\langle E \rangle$ then $\langle E \rangle$ (else $\langle E \rangle$)?
output : $\langle AT \rangle$		F (($\langle E \rangle$ (, $\langle E \rangle$))*)?
assign-output : $\langle E \rangle$		a
$\langle AT \rangle ::=$	<i>attribute declarations:</i>	$\langle LIT \rangle$
a $\langle T \rangle$ $\langle CD \rangle$		($\langle E \rangle$)
$\langle CD \rangle ::=$	<i>cardinalities:</i>	$\langle E \rangle \rightarrow a$ only exists
(l .. k)	<i>bounded</i>	$\langle E \rangle$ only-element
(l .. *)	<i>unbounded</i>	D { ($a = \langle E \rangle$ (, $b = \langle E \rangle$))* } }
$\langle E \rangle ::=$	<i>expressions:</i>	$\langle LIT \rangle ::=$
$\langle E \rangle$ or $\langle E \rangle$		True False
$\langle E \rangle$ and $\langle E \rangle$		i
not $\langle E \rangle$		r
$\langle E \rangle$ (single multiple)? exists		empty
$\langle E \rangle$ is absent		[($\langle E \rangle$ (, $\langle E \rangle$))*]
$\langle E \rangle$ contains $\langle E \rangle$		
$\langle E \rangle$ disjoint $\langle E \rangle$		
		<i>literals:</i>
		<i>booleans</i>
		<i>signed integers</i>
		<i>signed decimals</i>
		<i>empty literal</i>
		<i>list literals</i>
		$\langle T \rangle ::=$
		<i>basic types:</i>
		D boolean int number nothing

Operator precedence (note: this differs from Rosetta. The precedence of operators common with the C language are based on https://en.cppreference.com/w/c/language/operator_precedence.)

1. `->` (projection), `-> a only exists`
2. `only-element`
3. `exists`, `is absent`, `count`
4. `not`
5. `*` (multiplication), `/` (division)
6. `+` (addition), `-` (subtraction)
7. `=` (equality), `<>` (inequality)
8. `contains`, `disjoint`
9. `and`
10. `or`

Syntactic sugar

```
if e1 then e2 ≡ if e1 then e2 else empty
empty ≡ []
e is absent ≡ not (e exists)
```

Note: Nougá has a couple of differences compared to Rosetta.

1. Nougá replaces the multiple `assign-output` statements with a single statement that fully defines the output of a function. Instead of defining one attribute of the output per `assign-output` statement, you can use a record-like syntax to explicitly create an instance. (see the last option of expressions $\langle E \rangle$)
2. Empty list literals are allowed.
3. In Nougá you can write `not` expressions.
4. The `only-element` keyword can be written behind any expression.
5. The `only exists` is restricted to expressions that end with a projection `-> a`. This simplifies the runtime model (i.e. code generators) as attributes in Nougá do not need to keep track of their parent.

2 Auxiliary definitions

Data table $DT(D)$ is a mapping from data type names to data declarations. Function table $FT(F)$ is a mapping from function names to function declarations.

Attribute lookup

$$\frac{DT(D) = \text{type } D : a_1 \ T_1 \ C_1 \dots a_n \ T_n \ C_n}{\text{attrs}(D) = a_1 \ T_1 \ C_1, \dots, a_n \ T_n \ C_n}$$

$$\frac{\text{DT}(D) = \text{type } D \text{ extends } C : a_1 \ T_1 \ C_1 \dots a_n \ T_n \ C_n}{\text{attrs}(D) = \text{attrs}(C), a_1 \ T_1 \ C_1, \dots, a_n \ T_n \ C_n}$$

Supertypes

$$\frac{\text{DT}(D) = \text{type } D \text{ extends } E : \dots}{E \in \text{supertypes}(D)}$$

$$\frac{A \in \text{supertypes}(D) \quad \text{DT}(A) = \text{type } A \text{ extends } B : \dots}{B \in \text{supertypes}(D)}$$

Function lookups

$$\frac{\text{FT}(F) = \text{func } F : \text{inputs} : a_1 \ T_1 \ C_1 \dots a_n \ T_n \ C_n \ \text{output} : \dots}{\text{inputs}(F) = a_1 \ T_1 \ C_1, \dots, a_n \ T_n \ C_n}$$

$$\frac{\text{FT}(F) = \text{func } F : \text{inputs} : \dots \ \text{output} : a \ T \ C \dots}{\text{output}(F) = a \ T \ C}$$

$$\frac{\text{FT}(F) = \text{func } F : \dots \ \text{assign-output} : e}{\text{op}(F) = e}$$

3 Semantics

Semantic domain: \mathbb{D} .

Single value: \mathbb{D}_1

3.1 Semantics of Types

Semantics of basic types $\llbracket T \rrbracket$.

$\llbracket \text{boolean} \rrbracket = \mathbb{B} = \{ \text{true}, \text{false} \}$

$\llbracket \text{int} \rrbracket = \mathbb{Z}$

$\llbracket \text{number} \rrbracket = \mathbb{R}$

$\llbracket D \rrbracket = \{ a_k = \llbracket T_k \ C_k \rrbracket \mid k \in 1..n \}$

where $\text{attrs}(D) = a_1 \ T_1 \ C_1, \dots, a_n \ T_n \ C_n$

Semantics of types $\llbracket T \ C \rrbracket$.

$$\llbracket T \ (i..j) \rrbracket = \llbracket T \rrbracket^{\llbracket i \rrbracket : \llbracket j \rrbracket}$$

Semantics of cardinality limits $\llbracket c \rrbracket \in \mathbb{N} \cup \{ \infty \}$.

$$\llbracket i \rrbracket = i$$

$$\llbracket * \rrbracket = \infty$$

3.2 Semantical Algebra

Semantic algebra.

$$A^0 = \text{Unit} = \{ () \}$$

$$A^n = A \times A^{n-1}$$

$$A^{m:n} = \bigcup_{k \in m..n} A^k$$

$$A^* = A^{0:\infty}$$

Note: from the above definition, A^1 formally equals $A \times Unit$, so elements of this set are of the form $(a, ())$ where $a \in A$. I might sometimes write a instead of $(a, ())$ if it is clear from the context what is meant. (similar for A^n , where I will leave out the last element of the cartesian product)

$$_ or _ : \mathbb{B}^1 \times \mathbb{B}^1 \rightarrow \mathbb{B}^1 : (a, ()) or (b, ()) = (a \vee b, ())$$

$$_ and _ : \mathbb{B}^1 \times \mathbb{B}^1 \rightarrow \mathbb{B}^1 : (a, ()) and (b, ()) = (a \wedge b, ())$$

$$not(_) : \mathbb{B}^1 \rightarrow \mathbb{B}^1 : not((a, ())) = (\neg a, ())$$

$$(_) \rightarrow _ [] _ : \mathbb{B}^1 \times \mathbb{D} \times \mathbb{D} \rightarrow \mathbb{D} : ((a, ())) \rightarrow b [] c = \begin{cases} b, & a = true \\ c, & a = false \end{cases}$$

$$count(_) : \mathbb{D} \rightarrow \mathbb{Z}^1 : count((a_1, \dots, a_n, ())) = (n, ())$$

$$flatten_{A,n}(_) : (A^*)^n \rightarrow A^* :$$

$$\begin{aligned} & flatten_{A,n}((a_{11}, \dots, a_{1m_1}, ()), \dots, (a_{n1}, \dots, a_{nm_n}, ())) \\ & = (a_{11}, \dots, a_{1m_1}, \dots, a_{nm_n}, ()) \end{aligned}$$

$$contains(_, _) : \mathbb{D} \times \mathbb{D} \rightarrow \mathbb{B}^1 : contains((a_1, \dots, a_n, ()), (b_1, \dots, b_m, ()))$$

$$= \begin{cases} (true, ()), & \forall i \in 1..n : \exists j \in 1..m : a_i = b_j \\ (false, ()), & \text{otherwise} \end{cases}$$

$$disjoint(_, _) : \mathbb{D} \times \mathbb{D} \rightarrow \mathbb{B}^1 : disjoint((a_1, \dots, a_n, ()), (b_1, \dots, b_m, ()))$$

$$= \begin{cases} (true, ()), & \forall i \in 1..n : \forall j \in 1..m : a_i \neq b_j \\ (false, ()), & \text{otherwise} \end{cases}$$

$$onlyexists_{\{a_k = A_k \mid k \in 1..n\}, a_i}(_) : \{a_k = A_k \mid k \in 1..n\}^1 \rightarrow \mathbb{B}^1 :$$

$$onlyexists_{\{a_k = A_k \mid k \in 1..n\}, a_i}((\{a_k = v_k \mid k \in 1..n\}, ()))$$

$$= \begin{cases} (true, ()), & v_i \neq () \wedge \forall j \in 1..n : j \neq i \Rightarrow v_j = () \\ (false, ()), & \text{otherwise} \end{cases}$$

$$project_{\{a_k = A_k^{l_k:u_k} \mid k \in 1..n\}, a_i}(_) : \{a_k = A_k^{l_k:u_k} \mid k \in 1..n\}^* \rightarrow A_i^* :$$

$$project_{\{a_k = A_k^{l_k:u_k} \mid k \in 1..n\}, a_i}((\{a_k = v_{k1} \mid k \in 1..n\}, \dots, \{a_k = v_{km} \mid k \in 1..n\}, ()))$$

$$= flatten_{A_i,m}(v_{i1}, \dots, v_{im})$$

$$_ eq _ : \mathbb{D} \times \mathbb{D} \rightarrow \mathbb{B}^1 : (a_1, \dots, a_n, ()) eq (b_1, \dots, b_m, ())$$

$$\begin{aligned}
&= \begin{cases} (true, ()), & n = m \wedge \forall i \in 1..n : a_i = b_i \\ (false, ()), & \text{otherwise} \end{cases} \\
neq : \mathbb{D} \times \mathbb{D} \rightarrow \mathbb{B}^1 : (a_1, \dots, a_n, ()) \text{ neq } (b_1, \dots, b_m, ()) \\
&= \begin{cases} (true, ()), & n \neq m \vee \forall i \in 1..n : a_i \neq b_i \\ (false, ()), & \text{otherwise} \end{cases} \\
alleg : \mathbb{D} \times \mathbb{D}_1^1 \rightarrow \mathbb{B}^1 : (a_1, \dots, a_n, ()) \text{ alleg } (b, ()) \\
&= \begin{cases} (true, ()), & \forall i \in 1..n : a_i = b \\ (false, ()), & \text{otherwise} \end{cases} \\
allneq : \mathbb{D} \times \mathbb{D}_1^1 \rightarrow \mathbb{B}^1 : (a_1, \dots, a_n, ()) \text{ allneq } (b, ()) \\
&= \begin{cases} (true, ()), & \forall i \in 1..n : a_i \neq b \\ (false, ()), & \text{otherwise} \end{cases} \\
anyeq : \mathbb{D} \times \mathbb{D}_1^1 \rightarrow \mathbb{B}^1 : (a_1, \dots, a_n, ()) \text{ anyeq } (b, ()) \\
&= \begin{cases} (true, ()), & \exists i \in 1..n : a_i = b \\ (false, ()), & \text{otherwise} \end{cases} \\
anyneq : \mathbb{D} \times \mathbb{D}_1^1 \rightarrow \mathbb{B}^1 : (a_1, \dots, a_n, ()) \text{ anyneq } (b, ()) \\
&= \begin{cases} (true, ()), & \exists i \in 1..n : a_i \neq b \\ (false, ()), & \text{otherwise} \end{cases} \\
_plus_A_ : A^1 \times A^1 \rightarrow A^1 : (a, ()) \text{ plus}_A (b, ()) = (a + b, ()) \\
_subtract_A_ : A^1 \times A^1 \rightarrow A^1 : (a, ()) \text{ subtract}_A (b, ()) = (a - b, ()) \\
_mult_A_ : A^1 \times A^1 \rightarrow A^1 : (a, ()) \text{ mult}_A (b, ()) = (a * b, ()) \\
div : \mathbb{R}^1 \times \mathbb{R}^1 \rightarrow \mathbb{R}^1 : (a, ()) \text{ div } (b, ()) = (a/b, ()) \\
onlyelement(_) : \mathbb{D} \rightarrow \mathbb{D} : onlyelement((a_1, \dots, a_n, ())) \\
&= \begin{cases} (a_1, ()), & n = 1 \\ (), & \text{otherwise} \end{cases}
\end{aligned}$$

Note: equality is checked deeply, i.e. recursively on attributes of records.

Given $f : A_1 \times \dots \times A_n \rightarrow B$ where $A_1, \dots, A_n \subset \mathbb{D}$ and $B \subset \mathbb{D}$, let

$$\hat{f} : \mathbb{D}_\perp^n \rightarrow \mathbb{D}_\perp : \hat{f}(a_1, \dots, a_n) = \begin{cases} f(a_1, \dots, a_n), & (a_1, \dots, a_n) \in \text{Dom } f \\ \perp, & \text{otherwise.} \end{cases}$$

3.3 Semantics of Expressions

Some denotations depend on the type derivation of an expression. For this reason, I will evaluate typing derivations instead of expressions. However, because I only need this in a few cases, I will often omit the derivation, i.e. I will write $\llbracket e \rrbracket$ instead of $\llbracket \mathcal{D} :: \emptyset \vdash e : T \ C \rrbracket$ if the type $T \ C$ and the derivation \mathcal{D} are unimportant.

Values $\llbracket v \rrbracket$.

$\llbracket \text{True} \rrbracket = (\text{true}, ())$	E-TRUE
$\llbracket \text{False} \rrbracket = (\text{false}, ())$	E-FALSE
$\llbracket i \rrbracket = (i, ())$	E-INT
$\llbracket r \rrbracket = (r, ())$	E-NUMBER

Expressions $\llbracket e \rrbracket$.

$\llbracket \mathcal{D} :: \emptyset \vdash [e_1, \dots, e_n] : T \ C \rrbracket = \text{flatten}_{[T],n}(\llbracket e_1 \rrbracket, \dots, \llbracket e_n \rrbracket)$	E-LIST
$\llbracket e_1 \text{ or } e_2 \rrbracket = \llbracket e_1 \rrbracket \widehat{\text{or}} \llbracket e_2 \rrbracket$	E-OR
$\llbracket e_1 \text{ and } e_2 \rrbracket = \llbracket e_1 \rrbracket \widehat{\text{and}} \llbracket e_2 \rrbracket$	E-AND
$\llbracket \text{not } e \rrbracket = \widehat{\text{not}}(\llbracket e \rrbracket)$	E-NOT
$\llbracket e \text{ exists} \rrbracket = \begin{cases} \text{false}, & \llbracket e \rrbracket = () \\ \text{true}, & \text{otherwise} \end{cases}$	E-EXISTS
$\llbracket e \text{ single exists} \rrbracket = \begin{cases} \text{true}, & \widehat{\text{count}}(\llbracket e \rrbracket) = (1, ()) \\ \text{false}, & \text{otherwise} \end{cases}$	E-SINGLEEXISTS
$\llbracket e \text{ multiple exists} \rrbracket = \begin{cases} \text{true}, & \widehat{\text{count}}(\llbracket e \rrbracket) = (k, ()) \wedge k \geq 2 \\ \text{false}, & \text{otherwise} \end{cases}$	E-MULTIPLEEXISTS
$\llbracket e_1 \text{ contains } e_2 \rrbracket = \widehat{\text{contains}}(\llbracket e_1 \rrbracket, \llbracket e_2 \rrbracket)$	E-CONTAINS
$\llbracket e_1 \text{ disjoint } e_2 \rrbracket = \widehat{\text{disjoint}}(\llbracket e_1 \rrbracket, \llbracket e_2 \rrbracket)$	E-DISJOINT
$\llbracket e_1 = e_2 \rrbracket = \llbracket e_1 \rrbracket \widehat{eq} \llbracket e_2 \rrbracket$	E-EQUALS
$\llbracket e_1 <> e_2 \rrbracket = \llbracket e_1 \rrbracket \widehat{neq} \llbracket e_2 \rrbracket$	E-NOTEQUALS
$\llbracket e_1 \text{ all } = e_2 \rrbracket = \llbracket e_1 \rrbracket \widehat{alleq} \llbracket e_2 \rrbracket$	E-ALLEQUALS
$\llbracket e_1 \text{ all } <> e_2 \rrbracket = \llbracket e_1 \rrbracket \widehat{allneq} \llbracket e_2 \rrbracket$	E-ALLNOTEQUALS
$\llbracket e_1 \text{ any } = e_2 \rrbracket = \llbracket e_1 \rrbracket \widehat{anyeq} \llbracket e_2 \rrbracket$	E-ANYEQUALS
$\llbracket e_1 \text{ any } <> e_2 \rrbracket = \llbracket e_1 \rrbracket \widehat{anyneq} \llbracket e_2 \rrbracket$	E-ANYNOTEQUALS
$\left\llbracket \frac{\mathcal{D}_1 :: \emptyset \vdash e_1 : T \ (1..1) \quad \mathcal{D}_2 :: \emptyset \vdash e_2 : T \ (1..1)}{\emptyset \vdash e_1 + e_2 : T \ (1..1)} \right\rrbracket = \llbracket e_1 \rrbracket \widehat{plus}_{[T]} \llbracket e_2 \rrbracket$	E-PLUS

$\left[\frac{\mathcal{D}_1 :: \emptyset \vdash e_1 : T \text{ (1..1)} \quad \mathcal{D}_2 :: \emptyset \vdash e_2 : T \text{ (1..1)}}{\emptyset \vdash e_1 - e_2 : T \text{ (1..1)}} \right] = \llbracket e_1 \rrbracket \widehat{\text{subtract}}_{\llbracket T \rrbracket} \llbracket e_2 \rrbracket$	E-SUBS
$\left[\frac{\mathcal{D}_1 :: \emptyset \vdash e_1 : T \text{ (1..1)} \quad \mathcal{D}_2 :: \emptyset \vdash e_2 : T \text{ (1..1)}}{\emptyset \vdash e_1 * e_2 : T \text{ (1..1)}} \right] = \llbracket e_1 \rrbracket \widehat{\text{mult}}_{\llbracket T \rrbracket} \llbracket e_2 \rrbracket$	E-MULT
$\llbracket e_1 / e_2 \rrbracket = \llbracket e_1 \rrbracket \widehat{\text{div}} \llbracket e_2 \rrbracket$	E-DIV
$\llbracket e \text{ count} \rrbracket = \widehat{\text{count}}(\llbracket e \rrbracket)$	E-COUNT
$\left[\frac{\mathcal{D} :: \emptyset \vdash e : D \ C}{\emptyset \vdash e \rightarrow a : T \ C_a} \right] = \widehat{\text{project}}_{\llbracket D \rrbracket, a}(\llbracket e \rrbracket)$	E-PROJECT
$\llbracket \text{if } e_1 \text{ then } e_2 \text{ else } e_3 \rrbracket = (\llbracket e_1 \rrbracket) \widehat{\rightarrow} \llbracket e_2 \rrbracket \sqcup \llbracket e_3 \rrbracket$	E-IF
$\frac{\text{inputs}(F) = a_1 \ T_1 \ C_1, \dots, a_n \ T_n \ C_n}{\llbracket F(e_1, \dots, e_n) \rrbracket = \llbracket [a_1 \mapsto e_1, \dots, a_n \mapsto e_n] \text{ op}(F) \rrbracket}$	E-FUNC
$\frac{\text{attrs}(D) = a_1 \ T_1 \ C_1, \dots, a_n \ T_n \ C_n}{\llbracket D \{ a_1 : e_1, \dots, a_n : e_n \} \rrbracket = \{ a_1 = \llbracket e_1 \rrbracket, \dots, a_n = \llbracket e_n \rrbracket \}}$	E-CONSTRUCT
$\left[\frac{\emptyset \vdash e : D \text{ (1..1)}}{\emptyset \vdash e \rightarrow a \text{ only exists : boolean (1..1)}} \right] = \widehat{\text{onlyexists}}_{\llbracket D \rrbracket, a}(\llbracket e \rrbracket)$	E-ONLYEXISTS
$\llbracket e \text{ only-element} \rrbracket = \widehat{\text{onlyelement}}(\llbracket e \rrbracket)$	E-ONLYELEMENT

Note: equality between two empty lists (i.e. true) is different than the usual equality with null (i.e. always false) in other programming languages (and the official Rosetta documentation).

4 Typing

4.1 Declarative Typing

Some auxiliary definitions.

$$\begin{aligned}
\text{comparable}(T_1, T_2) &= T_1 <: T_2 \vee T_2 <: T_1 \\
\text{overlap}((l_1..u_1), (l_2..u_2)) &= u_1 \geq l_2 \wedge u_2 \geq l_1 \\
\text{comparable}^*(T_1 \ C_1, T_2 \ C_2) &= \text{comparable}(T_1, T_2) \wedge \text{overlap}(C_1, C_2) \\
\text{union}((l_1..u_1), (l_2..u_2)) &= (\min(l_1, l_2).. \max(u_1, u_2))
\end{aligned}$$

Subtyping $S <: T$.

$T <: T$	S-REFL
$\frac{S <: U \quad U <: T}{S <: T}$	S-TRANS
$\text{int} <: \text{number}$	S-NUM

$$\frac{DT(D) = \mathbf{type} \ D \ \mathbf{extends} \ E : \dots}{D <: E}$$

S-EXTENDS

List subtyping $T_1 \ C_1 <:^* T_2 \ C_2$.

$$\frac{T_1 <: T_2 \quad l_1 \geq l_2 \quad u_1 \leq u_2}{T_1 \ (l_1..u_1) <:^* T_2 \ (l_2..u_2)}$$

S-CARD

Typing rules $\Gamma \vdash e : T \ C$.

$$\frac{\Gamma \vdash e_1 : \mathbf{boolean} \ (1..1) \quad \Gamma \vdash e_2 : \mathbf{boolean} \ (1..1)}{\Gamma \vdash e_1 \ \mathbf{or} \ e_2 : \mathbf{boolean} \ (1..1)}$$

T-OR

$$\frac{\Gamma \vdash e_1 : \mathbf{boolean} \ (1..1) \quad \Gamma \vdash e_2 : \mathbf{boolean} \ (1..1)}{\Gamma \vdash e_1 \ \mathbf{and} \ e_2 : \mathbf{boolean} \ (1..1)}$$

T-AND

$$\frac{\Gamma \vdash e : T \ C}{\Gamma \vdash e \ \mathbf{exists} : \mathbf{boolean} \ (1..1)}$$

T-EXISTS

$$\frac{\Gamma \vdash e : T \ C}{\Gamma \vdash e \ \mathbf{single} \ \mathbf{exists} : \mathbf{boolean} \ (1..1)}$$

T-SINGLEEXISTS

$$\frac{\Gamma \vdash e : T \ C}{\Gamma \vdash e \ \mathbf{multiple} \ \mathbf{exists} : \mathbf{boolean} \ (1..1)}$$

T-MULTIPLEEXISTS

$$\frac{\Gamma \vdash e_1 : T_1 \ C_1 \quad \Gamma \vdash e_2 : T_2 \ C_2 \quad \mathbf{comparable}(T_1, T_2)}{\Gamma \vdash e_1 \ \mathbf{contains} \ e_2 : \mathbf{boolean} \ (1..1)}$$

T-CONTAINS

$$\frac{\Gamma \vdash e_1 : T_1 \ C_1 \quad \Gamma \vdash e_2 : T_2 \ C_2 \quad \mathbf{comparable}(T_1, T_2)}{\Gamma \vdash e_1 \ \mathbf{disjoint} \ e_2 : \mathbf{boolean} \ (1..1)}$$

T-DISJOINT

$$\frac{\Gamma \vdash e_1 : T_1 \ C_1 \quad \Gamma \vdash e_2 : T_2 \ C_2 \quad \mathbf{comparable}^*(T_1 \ C_1, T_2 \ C_2)}{\Gamma \vdash e_1 = e_2 : \mathbf{boolean} \ (1..1)}$$

T-EQUALS

$$\frac{\Gamma \vdash e_1 : T_1 \ C_1 \quad \Gamma \vdash e_2 : T_2 \ C_2 \quad \mathbf{comparable}^*(T_1 \ C_1, T_2 \ C_2)}{\Gamma \vdash e_1 <> e_2 : \mathbf{boolean} \ (1..1)}$$

T-NOTEQUALS

$$\frac{\Gamma \vdash e_1 : T_1 \ C \quad \Gamma \vdash e_2 : T_2 \ (1..1) \quad \mathbf{comparable}(T_1, T_2)}{\Gamma \vdash e_1 \ \mathbf{all} = e_2 : \mathbf{boolean} \ (1..1)}$$

T-ALLEQUALS

$$\frac{\Gamma \vdash e_1 : T_1 \ C \quad \Gamma \vdash e_2 : T_2 \ (1..1) \quad \mathbf{comparable}(T_1, T_2)}{\Gamma \vdash e_1 \ \mathbf{all} <> e_2 : \mathbf{boolean} \ (1..1)}$$

T-ALLNOTEQUALS

$$\frac{\Gamma \vdash e_1 : T_1 \ C \quad \Gamma \vdash e_2 : T_2 \ (1..1) \quad \mathbf{comparable}(T_1, T_2)}{\Gamma \vdash e_1 \ \mathbf{any} = e_2 : \mathbf{boolean} \ (1..1)}$$

T-ANYEQUALS

$$\frac{\Gamma \vdash e_1 : T_1 \ C \quad \Gamma \vdash e_2 : T_2 \ (1..1) \quad \mathbf{comparable}(T_1, T_2)}{\Gamma \vdash e_1 \ \mathbf{any} <> e_2 : \mathbf{boolean} \ (1..1)}$$

T-ANYNOTEQUALS

$$\frac{\Gamma \vdash e_1 : \mathbf{int} \ (1..1) \quad \Gamma \vdash e_2 : \mathbf{int} \ (1..1)}{\Gamma \vdash e_1 + e_2 : \mathbf{int} \ (1..1)}$$

T-PLUSINT

$\frac{\Gamma \vdash e_1 : \mathbf{number} \ (1..1) \quad \Gamma \vdash e_2 : \mathbf{number} \ (1..1)}{\Gamma \vdash e_1 + e_2 : \mathbf{number} \ (1..1)}$	T-PLUSNUMBER
$\frac{\Gamma \vdash e_1 : \mathbf{int} \ (1..1) \quad \Gamma \vdash e_2 : \mathbf{int} \ (1..1)}{\Gamma \vdash e_1 * e_2 : \mathbf{int} \ (1..1)}$	T-MULTINT
$\frac{\Gamma \vdash e_1 : \mathbf{number} \ (1..1) \quad \Gamma \vdash e_2 : \mathbf{number} \ (1..1)}{\Gamma \vdash e_1 * e_2 : \mathbf{number} \ (1..1)}$	T-MULTNUMBER
$\frac{\Gamma \vdash e_1 : \mathbf{int} \ (1..1) \quad \Gamma \vdash e_2 : \mathbf{int} \ (1..1)}{\Gamma \vdash e_1 - e_2 : \mathbf{int} \ (1..1)}$	T-SUBSINT
$\frac{\Gamma \vdash e_1 : \mathbf{number} \ (1..1) \quad \Gamma \vdash e_2 : \mathbf{number} \ (1..1)}{\Gamma \vdash e_1 - e_2 : \mathbf{number} \ (1..1)}$	T-SUBSNUMBER
$\frac{\Gamma \vdash e_1 : \mathbf{number} \ (1..1) \quad \Gamma \vdash e_2 : \mathbf{number} \ (1..1)}{\Gamma \vdash e_1 / e_2 : \mathbf{number} \ (1..1)}$	T-DIVISION
$\frac{\Gamma \vdash e : T \ C}{\Gamma \vdash e \ \mathbf{count} : \mathbf{int} \ (1..1)}$	T-COUNT
$\frac{\Gamma \vdash e : D \ (l..u) \quad \text{attrs}(D) = a_1 \ T_1 \ (l_1..u_1), \dots, a_n \ T_n \ (l_n..u_n)}{\Gamma \vdash e \rightarrow a_k : T_k \ (l * l_k..u * u_k)}$	T-PROJECT
$\frac{\Gamma \vdash e_1 : \mathbf{boolean} \ (1..1) \quad \Gamma \vdash e_2 : T \ C \quad \Gamma \vdash e_3 : T \ C}{\Gamma \vdash \mathbf{if} \ e_1 \ \mathbf{then} \ e_2 \ \mathbf{else} \ e_3 : T \ C}$	T-IF
$\frac{\begin{array}{c} \forall i \in 1..n : \Gamma \vdash e_i : T_i \ C_i \\ \text{inputs}(F) = a_1 \ T_1 \ C_1, \dots, a_n \ T_n \ C_n \quad \text{output}(F) = a \ T \ C \end{array}}{\Gamma \vdash F(e_1, \dots, e_n) : T \ C}$	T-FUNC
$\frac{\forall i \in 1..n : \Gamma \vdash e_i : T_i \ C_i \quad \text{attrs}(D) = a_1 \ T_1 \ C_1, \dots, a_n \ T_n \ C_n}{\Gamma \vdash D \{ a_1 = e_1, \dots, a_n = e_n \} : D \ (1..1)}$	T-CONSTRUCT
$\frac{x : T \ C \in \Gamma}{\Gamma \vdash x : T \ C}$	T-VAR
$\Gamma \vdash \mathbf{True} : \mathbf{boolean} \ (1..1)$	T-TRUE
$\Gamma \vdash \mathbf{False} : \mathbf{boolean} \ (1..1)$	T-FALSE
$\Gamma \vdash i : \mathbf{int} \ (1..1)$	T-INT
$\Gamma \vdash r : \mathbf{number} \ (1..1)$	T-NUMBER
$\frac{\forall i \in 1..n : \Gamma \vdash e_i : T \ (l_i..u_i)}{\Gamma \vdash [e_1, \dots, e_n] : T \ (\sum_{i \in 1..n} l_i \dots \sum_{i \in 1..n} u_i)}$	T-LIST
$\frac{\Gamma \vdash e : D \ (1..1) \quad \text{attrs}(D) = a_1 \ T_1 \ C_1, \dots, a_n \ T_n \ C_n}{\Gamma \vdash e \rightarrow a_k \ \mathbf{only \ exists} : \mathbf{boolean} \ (1..1)}$	T-ONLYEXISTS

$$\frac{\Gamma \vdash e : T \ C}{\Gamma \vdash e \text{ only-element} : T \ (0..1)} \quad \text{T-ONLYELEMENT}$$

$$\frac{\Gamma \vdash e : S \quad S <: T}{\Gamma \vdash e : T} \quad \text{T-SUB}$$

Typing function declarations F OK.

$$\frac{\text{inputs}(F) = a_1 \ T_1 \ C_1, \dots, a_n \ T_n \ C_n \quad \text{output}(F) = a \ T \ C \quad a_1 : T_1 \ C_1, \dots, a_n : T_n \ C_n \vdash \text{op}(F) : T \ C}{F \text{ OK}}$$

Note: for equality, there are two sensible choices as premises. Either $\Gamma \vdash e_1 : T \ C_1$ and $\Gamma \vdash e_2 : T \ C_2$ or $\Gamma \vdash e_1 : T \ C$ and $\Gamma \vdash e_2 : T \ C$. The second possibility eliminates equality checks that are always false because the operands can never have the same length.

4.2 Algorithmic Typing

These typing rules should be consistent with the declarative version, but they are defined in a way that is more straightforward to implement, because every rule is syntax-directed.

Introduce a new type **nothing** (i.e. the bottom type).

Join of basic types $\text{join}(T_1, T_2)$.

$$\begin{aligned} \text{join}(T, T) &= T \\ \text{join}(T_1, T_2) &= \text{join}(T_2, T_1) \\ \text{join}(\text{int}, \text{number}) &= \text{number} \\ \frac{E \in \text{supertypes}(D)}{\text{join}(D, E) &= E} \\ \frac{E \notin \text{supertypes}(D) \quad \text{DT}(E) = \text{type } E \text{ extends } E' : \dots \quad T = \text{join}(D, E')}{\text{join}(D, E) &= T} \\ \text{join}(\text{nothing}, T) &= T \end{aligned}$$

Extension of join to $n \in \mathbb{N}$ basic types.

$$\begin{aligned} \text{join}() &= \text{nothing} \\ \text{join}(T) &= T \\ \frac{n \geq 3 \quad T' = \text{join}(T_2, \dots, T_n) \quad T = \text{join}(T_1, T')}{\text{join}(T_1, \dots, T_n) &= T} \end{aligned}$$

Join for types $\text{join}^*(T_1 \ C_1, T_2 \ C_2)$.

$$\frac{T = \text{join}(T_1, T_2)}{\text{join}^*(T_1 \ C_1, T_2 \ C_2) = T \ C}$$

Basic subtyping $S <:: T$.

$T <:: T$	SA-REFL
$\text{int} <:: \text{number}$	SA-NUM
$\frac{E \in \text{supertypes}(D)}{D <:: E}$	SA-SUPER!
$\text{nothing} <:: T$	SA-NOTHING

Subtyping $T_1 C_1 <::^* T_2 C_2$.

$\frac{T_1 <:: T_2 \quad l_1 \geq l_2 \quad u_1 \leq u_2}{T_1 (l_1..u_1) <::^* T_2 (l_1..u_1)}$	SA-CARD
---	---------
